

**IMS: A fully integrated system with direct connection to microscopy and camera systems**

Imagic ims is a professional image management system for the acquisition, processing, storage, visualisation and presentation of digital images, movies and general documents.

Imagic has drawn upon its 20 years of expertise in the field of media management to create this new product.

Imagic ims provides a platform-independent, Java-based client/server architecture and supports the established database systems Oracle and SQL Server.

Tracking images requires collecting metadata from different devices: cameras, microscopes etc. Images in IMS not only link to this collected data but can also be used within the Reporting module of IMS showcase to create reports (PDF, MSWord) or slideshows (MSPowerPoint, Movie).

Ims offers a licensing concept which facilitates the configuration of individual workplaces tailored to different functional needs in the customer work environment.
